

A photograph of a misty forest path. The path is made of dark brown earth and leads into the distance, flanked by lush green ferns and other vegetation. Tall, slender trees with thick trunks stand in the background, their tops shrouded in a light mist. The overall atmosphere is serene and natural.

# ALL ABOUT TREES

PABLO OJEDA LUQUE

# Deciduous trees

All the leaves of these species fall usually when comes the fall of each year ,  
Coinciding with the arrival o cold weather and the shorter duration of the  
light of the day.

The wind and rain contribute to the fall.

Most of them live in the forest of  
the atlantic climate, they lose the leaves  
when environmental  
conditions are harsh.

# Evergreen trees

Copies of this type renew their leaves slowly, over several years, within a continuous process in which the new leaves grow before the old ones fall. Every day they lose a small percentage of the total number. Within the tropical regions, most of the trees in this type belong to the subclass of conifers.

Some can keep  
without much change  
for very long periods,  
even 17 years.

# BONSAI TREES

Bonsai trees are often thought to have originated from Japan , but records over 2,000 years ago show that trees begin to be grown in China. Around 1,500 years ago trees, many of which would have been collected from mountainous regions, were first grown as individual specimens and these can be seen clearly on ancient Chinese line drawings. Several centuries later, the Japanese began growing trees in pots. Nowadays, it is a hobby.
